ENDNOTE

THOMSON REUTERS

X

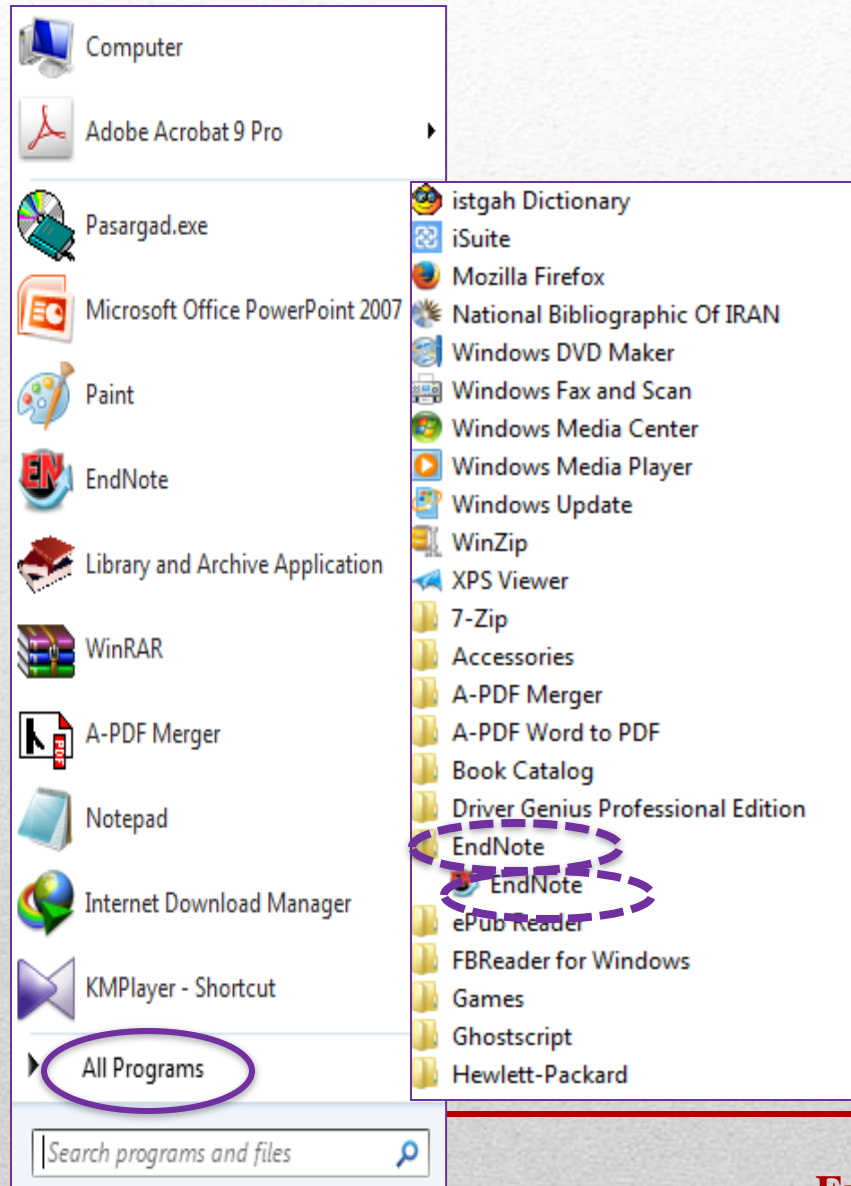

@ 3ddock - Fotolia.com

قابلیت های نرم افزار Endnote

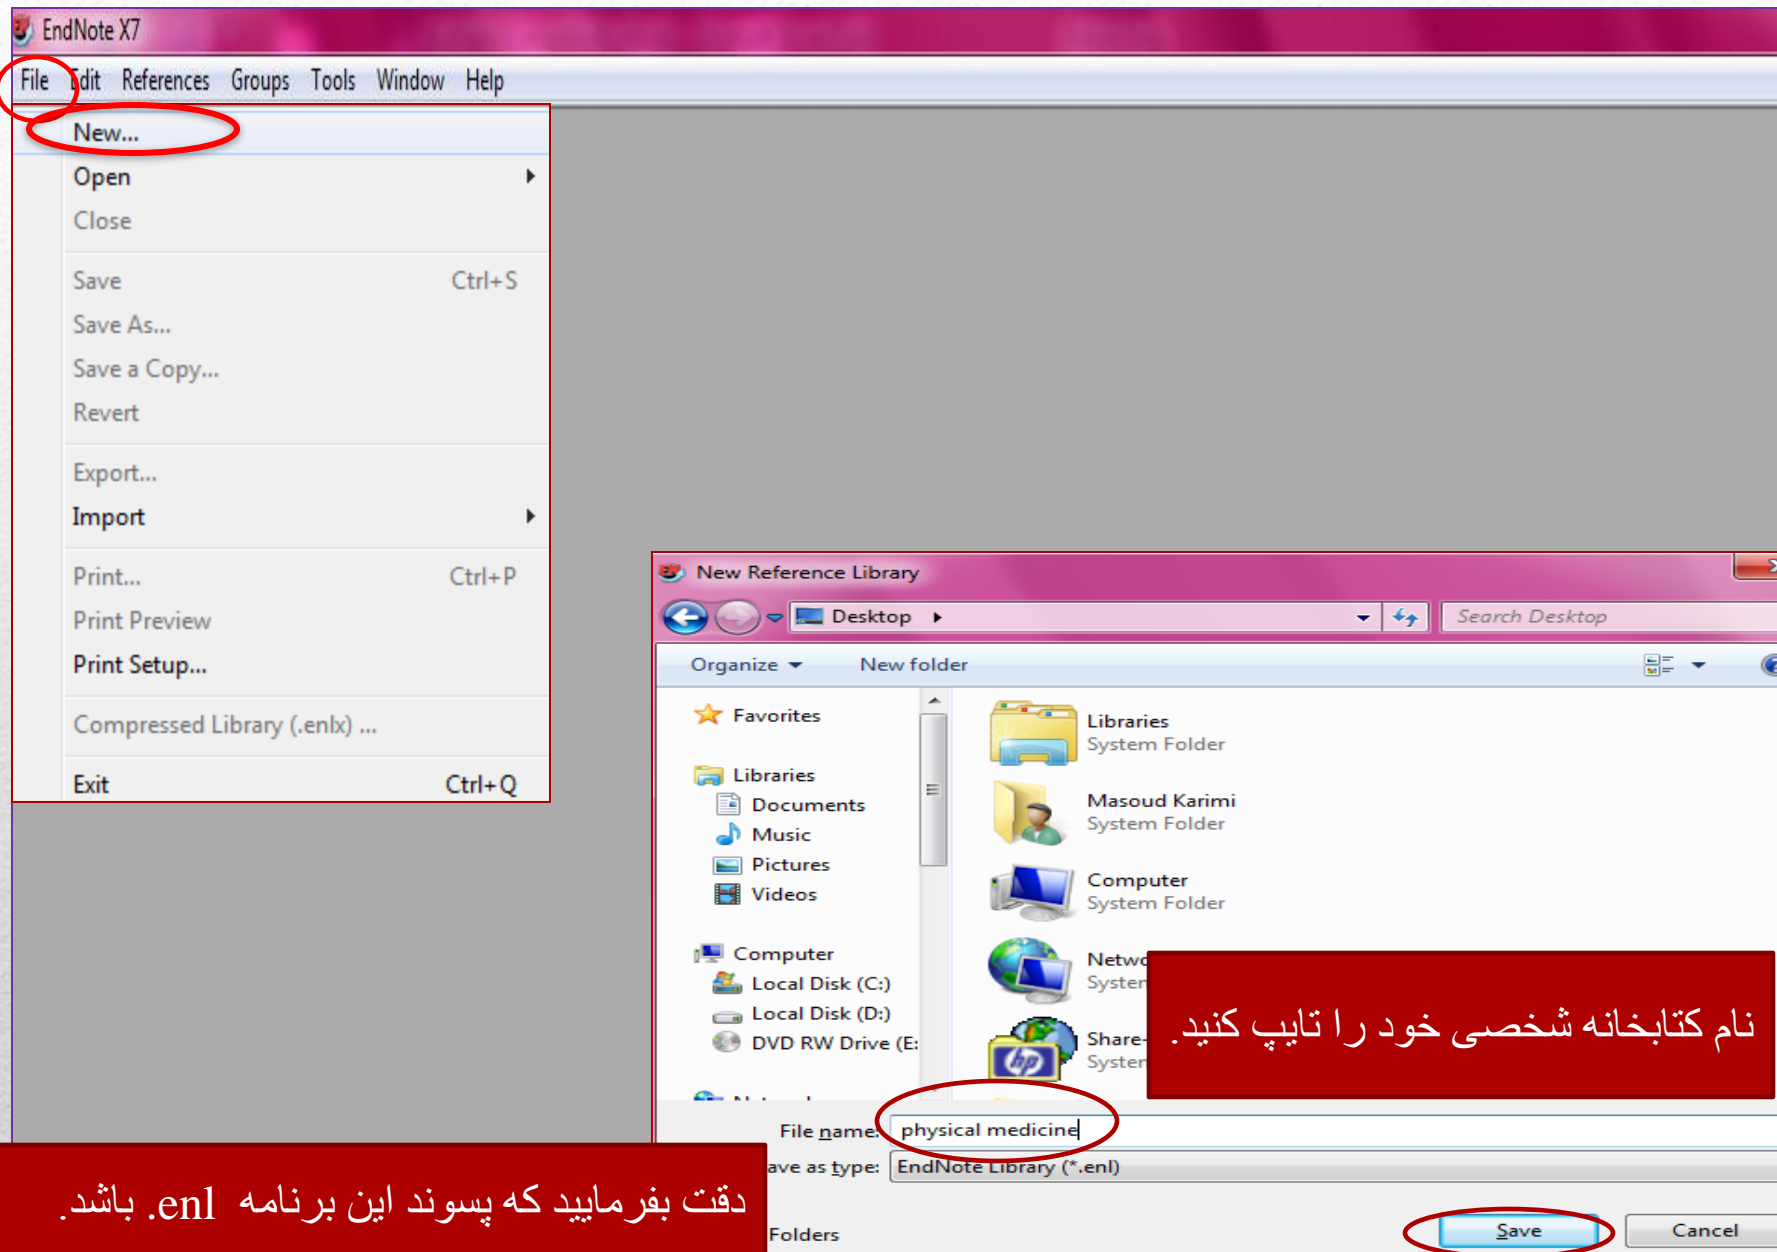

- ایجاد یک کتابخانه مجازی برای ذخیره و نگهداری مراجع
- برقراری اتصال مستقیم به بسیاری از بانکها و پایگاههای اطلاعاتی
- امکان جستجوی مراجع در کتابخانه مجازی بر اساس نام نویسنده، عنوان، ناشر، کلیدواژه و ...
- تهیه فهرست منابع برای نگارش مقاله، پایان نامه و کتاب... بر اساس ۴۵۰۰ سبک نگارش کتابشناختی
- امکان انتقال اطلاعات کتابشناختی منابع از طریق ورود اطلاعات به صورت دستی
- ذخیره و سازماندهی جداول، تصاویر در کتابخانه مجازی
-

شروع کار با Endnote

**Start menu, choose all Programs >
EndNote >EndNote Program**

پس از نصب برنامه با کلیک روی آیکون Endnote پنجره زیر ظاهر میشود.

دقت بفرمایید که پسوند این برنامه .enl باشد.

روش‌های ورود منابع به برنامه EndNote

- روش اول: تایپ دستی بخش‌های منابع
- روش دوم: وارد کردن مستقیم منابع از طریق برنامه EndNote
- روش سوم: وارد کردن منابع از طریق پایگاه‌های اطلاعاتی

ورود اطلاعات به صورت دستی

توصیه میشود تنها در صورتی کتب را به صورت دستی وارد نمایید که نتوانید اطلاعات را از اینترنت به کتابخانه شخصی وارد نمایید.

وارد کردن مستقیم منابع از طریق برنامه EndNote

در گوشه سمت چپ پنجره سه گزینه مشاهده می‌شود: گزینه ۱ حالت آفلاین و گزینه ۲ حالت آنلاین گزینه ۳ ترکیبی از حالت آفلاین و آنلاین، است. برای وارد کردن منابع از این طریق باید به حالت آنلاین بروید. در این بخش فهرستی از پایگاه‌ها را مشاهده می‌نمایید. برای مشاهده کامل روی **More** کلیک کنید. برخی مقالات این پایگاه‌ها رایگان هستند که مهم‌ترین آنها **PubMed (NLM)** و **Web of Science** هستند.

The screenshot shows a library search interface with the following elements:

- Top Bar:** Includes a "Vancouver" dropdown, a "Quick Search" button, and various utility icons.
- Left Sidebar:** Lists search options: "My Library", "Online References (0)", "Online Trash (0)", "Online Search", "Library of Congress (0)", "LISTA (EBSCO) (0)", "PubMed (NLM) (0)", and "Web of Science (TS) (0)".
- Search Area:** Features a "Search" button, "Options", and a "Search Remote Library" dropdown. It includes checkboxes for "Match Case" and "Match Words".
- Search Criteria:** Three criteria are defined: "All Fields" (Contains), "Year" (Contains, value: 2014), and "Title" (Contains, value: rehabilitation of knee).
- Results Table:** A table with columns: Author, Year, Title, Rating, and Journal.

Red dashed boxes and arrows highlight the "Search" button, the "Year" and "Title" criteria, the "PubMed (NLM)" option in the sidebar, and the "rehabilitation of knee" search term. A red box at the bottom contains the Persian text: "پایگاه مورد نظر را انتخاب کنید." (Select the desired database).

Neuromuscular Rehabilitation and Electrodiagnosis. 2. Peripheral Neuropathy

Lyn D. Weiss, MD, Jay M. Weiss, MD, Jeffrey S. Johns, MD, Jeffrey A. Strommen, MD, Chung-Tar Kim, MD, PhD, Faren H. Williams, MD, MS, Ira G. Reinkensmeyer, MD

ABSTRACT: Weiss LD, Weiss JM, Johns JS, Strommen JA, Kim C-T, Williams FH, Reinkensmeyer IG. Neuromuscular rehabilitation and electrodiagnosis. 2. Peripheral neuropathy. Arch Phys Med Rehabil 2005;86(3 Suppl 1):S11-7.

This self-directed learning module highlights peripheral neuropathies. It is part of the chapter on neuromuscular rehabilitation and electrodiagnosis in the Self-Directed Physiatric Education Program for practitioners and trainees in physical medicine and rehabilitation. This article specifically focuses on diagnostic criteria and classifications of peripheral neuropathy, including diabetic, alcoholic, carcinomatous, human immunodeficiency virus-associated, and critical illness polyneuropathy. Treatment options are reviewed. The causes for difficult to obtain nerve conduction studies are highlighted.

Overall Article Objective: To summarize the diagnosis, classification, and treatment of peripheral neuropathies.

Key Words: Alcoholic neuropathy; Carcinoma; Critical illness; Electrodiagnosis HIV; Peripheral neuropathies; Rehabilitation; Treatment outcome.

© 2005 by the American Academy of Physical Medicine and Rehabilitation

physical examination may help differentiate a PN (generally distal) from a localized peripheral nerve entrapment.

The diagnosis of PN typically requires an electrodiagnostic examination of at least 3 limbs, including both sensory and motor studies, as well as needle testing. The temperature of the limbs should be maintained at 32°C in the upper extremities and 30°C in the lower extremities. Decreased temperatures can lead to spuriously false results on nerve conduction studies (NCS), including increased amplitudes, prolonged latencies, and slowed nerve conduction velocities (NCV).

Once the diagnosis of PN is clear, the electromyographer should clarify its type in order to determine the cause and severity. PN can be grouped into primarily axonal, primarily demyelinating, or mixed. It can further be divided into these neuropathies that affect primarily motor fibers, sensory fibers, or both. It can be classified as segmental (affecting only certain areas of the nerve) or uniform (affecting the entire length of the nerve). The referring physician will also need to know the severity of the PN. Furthermore, a thorough electrodiagnostic study may reveal a superimposed peripheral nerve entrapment,

ABSTRACT

The effect of timing is uncertain on the electrophysiology of Guillain–Barré syndrome (GBS). On this study however depend the usefulness of systematic serial studies performed at specific time intervals. We retrospectively analysed records of 118 consecutive patients with GBS from Birmingham, UK, (2001–2012), studied between 0–14 days, or 15–42 days post-onset using new criteria which we recently proposed [4]. Rates of acute inflammatory demyelinating polyneuropathy (AIDP) ($p = 0.45$), axonal GBS ($p = 0.32$) and equivalet forms ($p = 0.46$) were similar for both timings. Similarly, no significant differences between timings were observed using Hadden et al. criteria. Proportions were comparable to published serial studies for both timings, for AIDP ($p = 0.25$, $p = 0.31$) and axonal GBS ($p = 0.71$, $p = 0.90$) but were higher than with serial studies for equivalet forms in patients studied on days 0–14 ($p = 0.012$), although not in those studied on days 15–42 ($p = 0.17$). This suggests that over the initial 6 weeks post-onset, timing fails to influence subtype proportions in a large GBS cohort, irrespective of criteria used. Repeat studies appear therefore unlikely to be helpful when systematically performed within this time frame, except in equivalet cases. The benefit of repeat studies remains possible at other times but may need to be individualised, and requires future prospective evaluation.

© 2015 Elsevier B.V. All rights reserved.

1. Introduction

The effect of timing on electrophysiology of Guillain–Barré syndrome (GBS) has been the object of several studies in recent years [1,2]. These have consistently demonstrated a change in proportion of GBS subtypes with a described partial shift from acute inflammatory demyelinating polyneuropathy (AIDP) to axonal GBS. The benefit of serial studies has as a result been suggested and considered the gold-standard for diagnosis of GBS subtype. However, serial studies have been performed between 7 and 70 days post-onset rather than at specific time points [1], making the important issue of most appropriate timing of repeat electrophysiology. Serial studies were in addition interpreted using criteria for GBS of poor specificity for demyelination and low sensitivity to identify axonal forms [3]. We have since recently proposed new electrophysiological criteria for Guillain–Barré syndrome (GBS) subtypes [4]. These were based on stricter demyelinating cut-offs [5], whose reliability have since been confirmed in multiple populations with chronic inflammatory demyelinating polyneuropathy (CIDP) [6,7]. We in addition utilised new data on axonal GBS subtypes to add parameters in order to increase the detection of this subcategory of patients. With these new proposed criteria [4], proportions of acute inflammatory demyelinating polyneuropathy (AIDP), axonal GBS and equivalet forms were similar to those obtained by other investigators with most informative serial, although non-homogeneously timed studies, using previous criteria [1,2].

The timing of nerve conduction may directly impact on the proportion of subtypes in a GBS cohort, as shown by the previously published serial studies [1,2]. Late electrophysiological results are analyzed as found at a previous moment, irrespective of earlier findings. As a result, global findings at different timings in a large cohort of GBS patients may therefore be helpful in evaluating the potential benefits of serial studies. We here tried to determine the effects of timing on proportions of GBS subtypes in different patients having undergone “early” (0–14 days post-onset) or “delayed” (15–42 days post-onset) studies, in an attempt to ascertain the eventual benefit of serial studies within this time frame.

2. Methods

We retrospectively reviewed our institutional database of patients admitted with a diagnosis of GBS between 2001 and 2012 at the Queen Elizabeth Hospital, Birmingham. The diagnosis was made in each case in accordance with established clinical criteria [8]. Patients included had undergone electrophysiological testing at our center, of at least 3 motor and 2 sensory nerves within 6 weeks of symptom-onset. Electrophysiology was performed according to standard methods by a qualified senior physician trained and experienced in electromyography.

REVIEW ARTICLE

Incidence, Prevalence, Costs, and Impact on Disability of Common Conditions Requiring Rehabilitation in the United States: Stroke, Spinal Cord Injury, Traumatic Brain Injury, Multiple Sclerosis, Osteoarthritis, Rheumatoid Arthritis, Limb Loss, and Back Pain

Vincent Y. Ma, BA,^{1,2,3} Leighton Chan, MD, MPH,⁴ Kadir J. Carruthers, BS^{1,2,3}

From the ¹Rehabilitation Medicine Department, Clinical Center, National Institutes of Health, Bethesda, MD and ²Care Western University School of Medicine, Cleveland, OH.

Abstract

Objective: To determine the relative incidence, prevalence, costs, and impact on disability of 8 common conditions treated by rehabilitation professionals.

Design: Comprehensive bibliographic searches using MEDLINE, Google Scholar, and Scopus (June 2013).

Data Extraction: Two review authors independently screened the search results and performed data extraction, highly sensitive to even identified that had relevant data on the following conditions: Stroke, Spinal Cord Injury, Traumatic Brain Injury, Multiple Sclerosis, Osteoarthritis, Rheumatoid Arthritis, Limb Loss, and Back Pain.

Data Synthesis: Back pain and arthritis (osteoarthritis, rheumatoid arthritis) are the most common and costly conditions we analyzed, affecting more than 100 million individuals and costing greater than \$200 billion per year. Traumatic brain injury, which has common but relatively rare back pain, carries enormous per capita direct and indirect costs, mostly because of the young age of those involved and the severe disability that it may cause. Finally, stroke, which is often listed as the most common cause of disability, is likely second to both arthritis and back pain in its impact on functional limitations.

Conclusions: Of the common rehabilitation diagnoses we studied, musculoskeletal conditions such as back pain and arthritis likely have the most impact on the health care system because of their high prevalence and impact on disability.

Archives of Physical Medicine and Rehabilitation 2014;95:100-105
 © 2014 by the American Congress of Rehabilitation Medicine

In 2011, an estimated 77.9 million people (12.5% of the U.S. population) were living with a disability.¹ The impact of disability is significant, aside from the numerous direct medical costs related to disability, which were estimated at \$190 billion in 1994,² medical problems have considerable personal and societal impact. Medical costs account for more than 60% of all personal expenditures.³ Government and private programs to support employment-aged individuals with disabilities who do not have jobs are also estimated at \$221 billion per year.⁴ These figures may rise with the aging of the U.S. population.

With many demographic changes looming, it is important to understand the ongoing impact of disability. Quantifying the national burden of disability is integral to understanding its impact on society and can help direct clinical resources. In

روش دوم: در این روش رفرنس های مربوط با گروه را انتخاب کرده و سپس رایت کلیک می کنید و گزینه Add references to و Creat custom group را انتخاب نمایید.

The screenshot displays a reference management application interface. On the left, a sidebar shows 'My Library' with categories: 'All References (52)', 'Imported References (6)', 'Unfiled (52)', 'Trash (0)', 'My Groups', and 'Find Full Text'. The main area features a search bar with 'Search Whole Library' and options for 'Match Case' and 'Match Words'. Below the search bar, a dropdown menu is open, showing options: 'Record Summary...', 'New Reference', 'Edit References', 'Move References to Trash', 'Add References To', 'Copy References To', 'E-mail Reference', 'Remove References From Group', 'Cut', 'Copy', 'Copy Formatted', 'Paste', 'Mark as Read', 'Mark as Unread', 'Rating', 'Show All References', 'Show Selected References', 'Hide Selected References', 'File Attachments', 'PDF Viewer', 'Find Full Text', 'Find Reference Updates...', and 'URL'. The 'Add References To' option is highlighted with a red box. Below the menu, a table of references is visible, with the entry for 'Broghammer, J. 2015 Editori...' highlighted in red. The right side of the interface shows a preview of a document titled 'Reconstructive Urology' with a sub-heading 'Urinary Diversion: How Experts Divert' and a 'Create Custom Group...' button highlighted in a red box.

Thyrotropin Suppression Increases the Risk of Osteoporosis Without Decreasing Recurrence in ATA Low- and Intermediate-Risk Patients with Differentiated Thyroid Carcinoma

Laura Y. Wang,¹ Andrew W. Smith,¹ Frank L. Palmer,¹ R. Michael Tuttle,² Adhar Mahrous,² Iain J. Nixon,² Snehil G. Patel,¹ Ian Ganly,² James A. Fagin,² and Laura Boucek¹

Background: Levotyrosine, despite lack of concern about minimizing toxicity from side effects and the risk of osteoporosis (DTC).
Methods: A total of 77 patients with a median age of 48±14 years, and a median TSH ≤0.4 mIU/L and cancer, postoperative disease was only examined in
Results: A total of 43/

osteoporosis, and 17/77 patients experienced an increase in the risk of osteoporosis (HR 1.02, p=0.996 [CI 0.54–1.91]), patients treated to a median TSH ≤0.4 mIU/L were at increased postoperative risk of a composite outcome of AF and osteoporosis (HR 2.1, p=0.02 [CI 1.003–4.3]) compared to those not suppressed. A differential risk of AF alone (HR 0.78, p=0.63 [CI 0.3–2.1]) was not detected, but postoperative osteoporosis was increased among women with a suppressed TSH compared to those not suppressed (HR 5.5, p=0.023 [CI 1.2–20.2]). The increased risk of postoperative osteoporosis disappeared when the patient's median TSH was maintained around 1 mIU/L.

Conclusion: TSH suppression significantly increases the risk of postoperative osteoporosis without changing tumor recurrence in ATA low- and intermediate-risk patients with DTC. Future interventions should focus on avoiding harm in indolent disease.

Introduction

TOTAL THYROIDECTOMY WITH OR WITHOUT ¹³¹I ABLATION, followed by long-term levothyroxine suppression of thyrotropin (TSH) is the traditional treatment for well-differentiated thyroid carcinoma (DTC) (1–4). Currently, most patients with thyroid cancer are given a dose of levothyroxine that suppresses TSH levels below the normal range, inducing a state of subclinical hyperthyroidism. The rationale for this approach stems from experimental and clinical data showing

that TSH stimulates thyroid cell proliferation, radiiodine uptake, and thyroglobulin (Tg) production (5–8). Removing this stimulus, at least theoretically, will inhibit growth of residual neoplastic tissue (5,6,9).

In patients affected by DTC, TSH suppression with levothyroxine is associated with a decreased risk of tumor recurrence (5,10–14), and endogenous or exogenous increases in TSH may occasionally induce clinical progression of thyroid cancer (15,16). Doses of levothyroxine that reduce circulating TSH to 0.4 mIU/L reportedly induce maximum

Back pain

Back pain is a very common condition, with an incidence of 139 per 100,000 person-years in the United States based on data from the National Electronic Injury Surveillance System. publication by the Centers for Disease Control and Prevention's National Center for Health Statistics. 28.4% of adults older than 18 years had experienced lower back pain in the past 12 months. This figure is at the high end of the findings of a systematic review of 15 studies published in 2007, in which reported annual rates of low back pain were in the range of 5% to 15%. According to data from the 2005 Survey of Income and Program Participation, 7.6 million adults reported lower back or spine problems as the main cause of their disability.

Back pain significantly limits work and daily activity. According to data from the National Health Interview Survey (NHIS), Americans lost a cumulative 149 million work days to lower back pain in 1988.

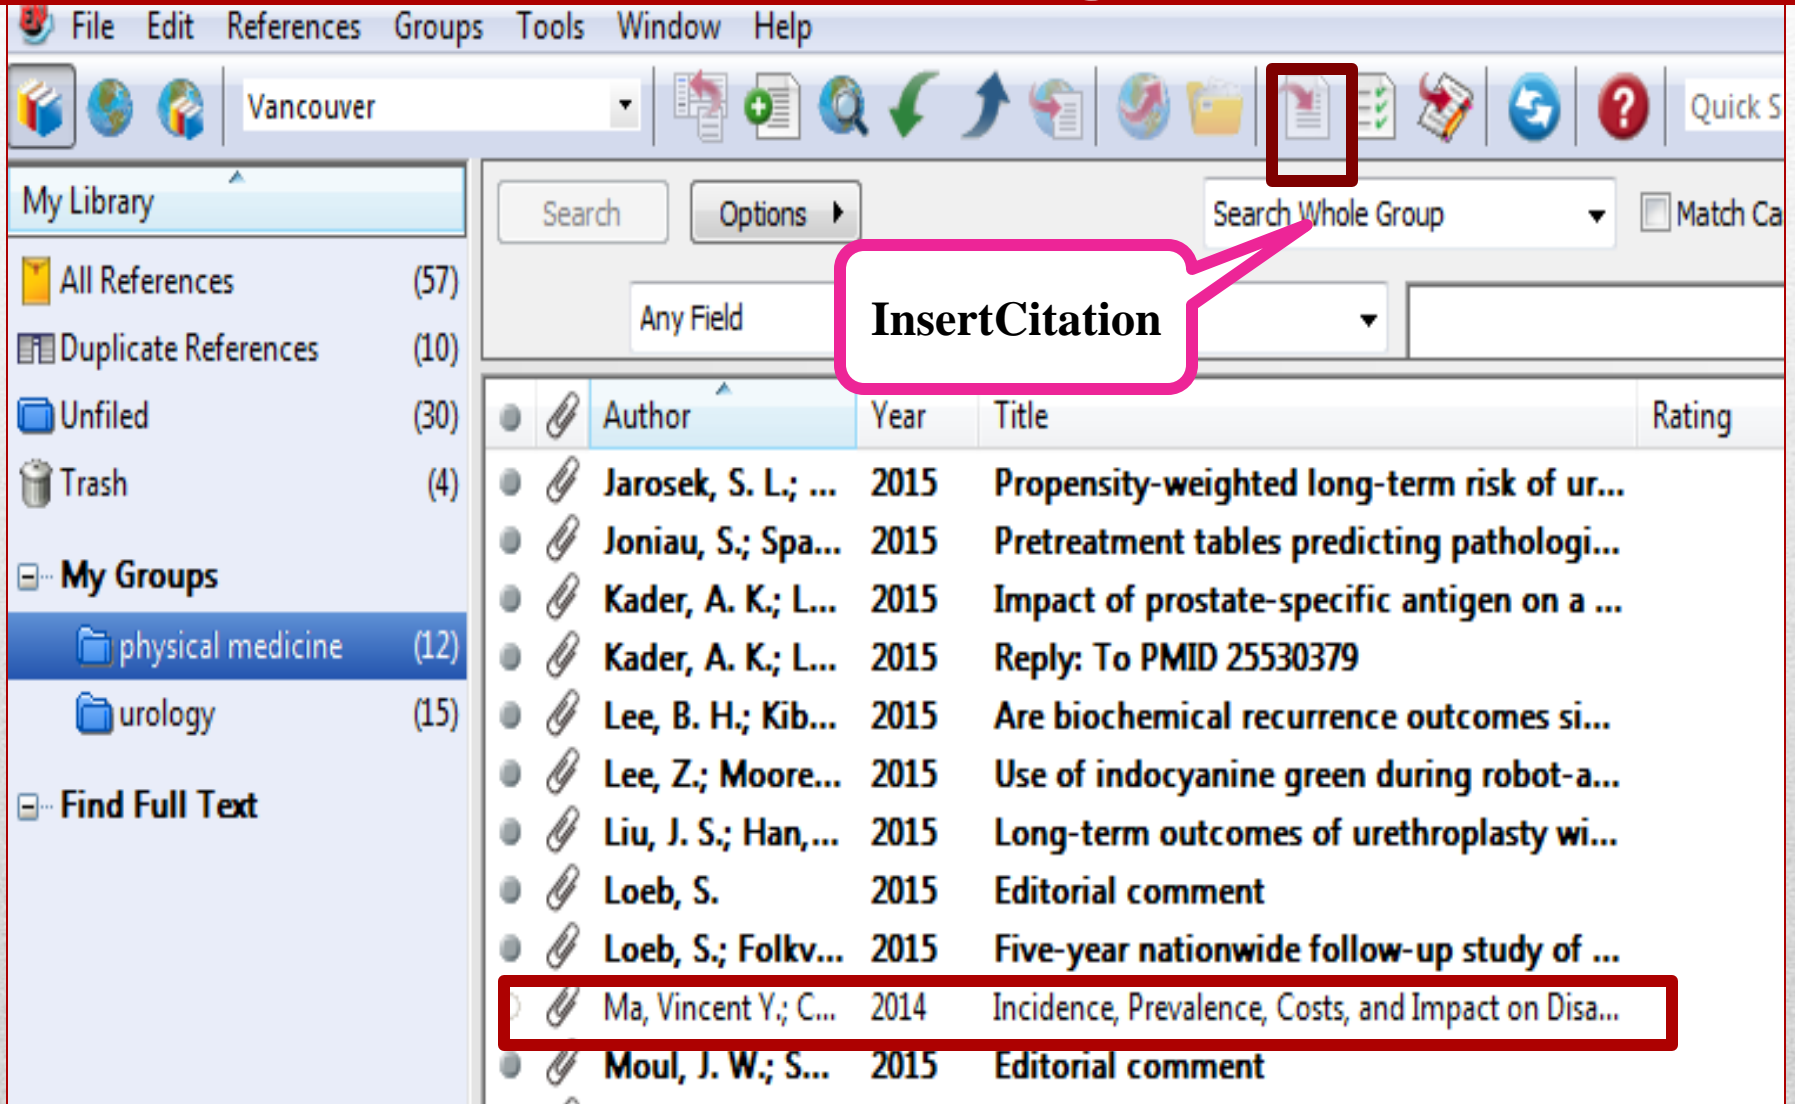

In the nationally representative Medical Expenditure Panel Survey, 24.7% of adults reported chronic back problems reported limitations in their physical functions. More than 7 million adults have activity limitations because of chronic back conditions, according to the National Arthritis Data Workgroup's analyses of the National Health and Nutrition Examination Survey (NHANES) and the NHIS.
